Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of aerobic exercise at 60% of the maximum HR. The control group did not exercise. The HR and EE were measured at rest and during exercise at 60% of the maximum HR. The HR and EE were significantly higher in the training group than in the control group at rest and during exercise. The results of this study suggest that a 10-week training program can improve the HR and EE of sedentary, middle-aged women.
